

The Department of Psychiatry & Behavioral Sciences at Stanford University's School of Medicine is looking for a motivated and compassionate Clinical & Neuroimaging Research Coordinator for a new project called UNFEAR (Using the Neuroscience of Fear Extinction for Anxiety Reduction). The aim of the project is to make cognitive behavior therapy for anxiety more effective through a better understanding of the neurobiology of fear and safety learning. We are looking for a Research Coordinator to work closely with the Principal Investigator and be an active contributor to all aspects of the study.

The right person for this job will be able to hit the ground running and take responsibility for participant recruitment and data organization to include collecting structural and functional MRI data as well as being able to conduct diagnostic participant interviews. We are looking for someone who can trouble-shoot independently while recognizing when to ask questions. The primary duties involve keeping the study running smoothly, however, we also anticipate opportunities for professional development in psychological research and/or practice. A sense of scientific curiosity is a must!

Interested candidates should include a CV and Cover Letter addressing how your education and experience relate to the position. Apply at: <https://careerssearch.stanford.edu/jobs/clinical-neuroimaging-research-coordinator-3170>
